

UCIP Review Handoff

Summary

This project is a working local prototype of a unified camera intelligence platform. It includes a FastAPI backend, JWT auth, camera registry, event ingest, watchlist matching, alerting, WebSocket dashboard updates, and a React/Vite frontend demo.

Demo credentials (local demo only)

- Operator: operator@demo.local / Operator@12345
- Admin: admin@demo.local / Admin@12345

Completed work

- Camera registry and search/filtering
- Live dashboard with camera status and event tiles
- Alerting and acknowledgement flow
- Movement tracking by entity value
- Watchlist management and seeded demo data
- End-to-end local prototype run without Docker

Limitations

- Prototype uses SQLite and in-process WebSocket broadcasting for local simplicity.
- The detector is synthetic rather than a real AI inference service.
- Video streams are simulated rather than connected to real RTSP feeds.

Improvements with more time

- Integrate real inference pipeline and production event bus.
- Add automated tests and CI checks.
- Replace local-only storage with managed Postgres and Redis/Kafka services.
- Harden auth and deployment security for production use.

Security note

No secrets, private keys, or production credentials have been committed to this repository.
